FIFTEENTH

MORTUARY REPORT

FOR THE YEAR BEGINNING 1ST FEBRUARY 1862.

THE registered mortality of the past year has been 15,158, to which, being added 354 still-births, a total mortality of 15,512 is the result. This differs but very slightly from the average of the last twelve years, * and is somewhat less than that of 1861. In the deaths after birth, the proportion of the sexes has been 130·8 males to 100 females, which is, with one exception, that of 1849, a greater disproportion than has yet been recorded.

Though with considerable fluctuation, the excess of male deaths has been on the whole gradually rising of late years. This has been before remarked, and attributed to the increasing influx of labourers and others, drawn to the place by its progressive commercial development. That this is indeed the case, would appear by the fact, that the proportion borne to the total mortality by that which falls under the ages of the greatest bodily activity, say from 15 to 55, is in Bombay excessively large. During the last year, 46·1 per cent. of the total deaths fell within these ages, whereas in London, the percentage of deaths at the same period of life is but 26·8 (1860), and that of all England still less, or 26·2. That this does not arise from any very deficient mortality in Bombay at ages under puberty, was shown in the Mortuary Reports for 1850 and 1860, where it was seen to approach very nearly to the English mortality. The great difference in the proportion of deaths here and in Europe is, according to the Registers, at ages above 55 or 60, which here scarcely exceed 12 per cent, but in London

* If the average of ten years only is taken, the deaths in 1862 will be seven per cent. in excess.

are nearer 30 per cent. although, for the reason above stated, this difference is not entirely or necessarily due to the greater longevity of European populations.

As the fluctuating part of the population in Bombay may be supposed to be smaller in the Monsoon than at other times, some insight into the effect of the influx of strangers on the total mortality, may be gathered from an examination of the number and nature of the deaths at different periods of the year. It may be assumed, that the principal migration, chiefly of adult males, commences about October, and that the emigration terminates in May or June. The maximum population may therefore be looked for about the months of January and February. Now, the total deaths during the past year in the several trimestral periods, beginning with February, is for February, March, and April 3,983; for May, June, and July 3,556; for August, September, and October 3,705; and for November December, and January 3,914; which so far confirms this view: but as these numbers are to some extent influenced by the prevalence of epidemics at different seasons, it will be better to take the average mortality during the last ten years.

TABLE A.

Deaths during the several Months and Quarters of the year. Mean of 10 years, 1853 *to* 1862.

February	1,155	1st Quarter 3,969.
March	1,369	
April	1,445	
May	1,368	2nd Quarter 3,823.
June	1,274	
July	1,181	
August	1,036	3rd Quarter 2,948.
September	961	
October	951	
November	988	4th Quarter 3,393.
December	1,135	
January	1,270	
Total....	14,133	

These results, though taken from a different series of years, very closely correspond with those diagrammatically shown in the Mortuary Report for 1857; "there are two maxima, the first in January, the second and greatest in April; while the minima are, the first in February, and the second, which is by far the greater, in October."

But in order to eliminate the effects which general sanitary conditions may have in producing variations in the mortality at different ages, and in the two sexes, and at the several periods of the year, and to obtain as true a mean result as possible, it is necessary to note at the same time how the age at death, and how the proportion between the sexes varies in the several months, or rather, as our tables only give these data quarterly, for the several quarters. The following tables have been compiled from Table XXVI. of this and former returns:—

TABLE B.

Proportion of Male to 100 *Female deaths at all ages, for* 10 *years,* 1853 *to* 1862.

	1st Quarter.	2nd Quarter.	3rd Quarter.	4th Quarter.	Year.
1853	115·7	110·1	115·6	130·2	118·2
1854	122·4	122·2	124·9	150·2	128·1
1855	126·8	117·4	114·2	133·2	122·5
1856	125·7	121·2	126·9	133·0	126·8
1857	124·5	127·2	119·5	125·8	124·5
1858	119·0	114·3	120·7	127·8	120·0
1859	119·2	129·4	127·2	138·7	128·9
1860	118·7	118·0	122·5	131·0	121·8
1861	127·5	112·1	125·2	150·1	129·4
1862	138·4	127·8	120·5	136·4	130·8
Mean.	123·8	120·0	121·7	135·6	125·1

TABLE C.

Proportion of Deaths, between the ages of 14 *and* 55, *to the total mortality in the four Quarters of the year, for the ten years,* 1853 *to* 1862.

	1st Quarter.	2nd Quarter.	3rd Quarter.	4th Quarter.	Year.
1853	37·1	35·0	43·6	50·0	41·7
1854	47·4	46·8	42·9	50·2	46·9
1855	68·3	45·5	43·8	50·0	45·7
1856	50·5	45·9	44·4	47·8	47·6
1857	39·1	39·9	44·4	50·0	42·7
1858	38·1	42·0	42·9	48·5	42·2
1859	41·2	49·4	46·9	47·8	46·6
1860	38·3	36·2	43·0	42·1	39·4
1861	32·8	32·1	43·7	51·8	40·6
1862	48·8	44·3	41·4	49·2	46·1
Mean.	42·2	41·7	43·7	48·7	43·9

It appears then that, whereas in respect to the general mortality, the order of the several quarters, commencing with the highest, is as follows:—1st, 2nd, 4th, 3rd, the mortality between the ages of 14 and 55 is greatest in the 4th quarter and least in the 2nd, and it is also in the 4th quarter that the excess of male deaths is by far the greatest, the other three quarters differing little from each other. Thus, as might have been expected, it is in the months of November, December, and January that the influence of the change of climate upon the fresh comers is most distinctly seen in the increased mortality at the adult ages shown in Table C, and that these contain a considerable excess of males, is apparent from Table B.

This very fluctuating state of the population will influence the correctness of the proposed census; as it may be difficult, by a single enumeration, to ascertain with any degree of precision the *average* population. If the census be taken but once in the year, probably either of the months of April or November would be the best to select for this purpose.

The slight degree in which the numbers under the 3rd Quarter in

both the Tables B and C vary from the mean, is also instructive, as showing that at this period of the year the population is more steady, consisting mainly of permanent residents.

The deaths from *Cholera* were 2,634, a little above the average, distributed more equally than usual over the whole year. *Small-pox* and *Measles* caused very few deaths; the former only 169, and the latter but 29—far below the average; making a total of deaths from *epidemic* diseases of 2,832.

Under *Fevers* 6,933 deaths are recorded, a little less than usual. Diseases of the *Nervous System*, chiefly tetanus and convulsions, carried off 632, and diseases of the *Respiratory System* 1,048, both rather below the average. From diseases of the *Alimentary System* the deaths were 1,862, and from *Cachexies* and *Debility* 1,246, both large numbers.

Under diseases of the *Sexual System* and *Child-bearing* 149 deaths are registered, of which no less than 117 were due to that terrible affection puerperal tetanus, which annually contributes from one-half to one per cent. of the entire mortality of the town. There were 38 deaths from *Leprosy*.

The deaths from *Accident* and *Violence* were 178, which is less than last year, but about the usual number; 72 were drowned; from carriages and horses the deaths were 13 only, a marvellous result, considering the reckless mode of driving which is so common, and the very careless and leisurely habits of the foot passengers. There were 4 fatal Railway accidents; 29 met their death by falls of various kinds; 2 were crushed by falling rock; 6 by the fall of houses or walls, and 4 by the fall of goods by the giving way of tackle; 7 died of the direct effects of drinking, 5 of poison, and 7 by hanging, of whom 3 were executed by judicial sentence; 2 were fatally lacerated by a tiger, and 3 died of snake bite; 2 of gunshot wounds, and 4 of stabs; 5 were burnt to death. The suicides, including those who met their death while in a state of delirium or fit, were 11; one of these was drowned in a rice field, covered probably with only a few inches of water. But 39 bodies were "found drowned," of which an unknown number must have been suicides.

Regarding the localities, it appears that in all the sections of District A, including Colaba, the Fort, and the Esplanade, the mortality has been much less than in the year before, and below the average. In District B,

containing the Market, Mandwee, and Oombhurkaree, and in District C, containing Dhobee Tuláo, Bhooleshwur, and Khara Tuláo and Girgaon, much the same as last year, but on the whole somewhat less. In Mazagon the mortality has been unusually large (due in a great measure to cholera), but that of Kamateepoora has sunk from 1,762 to 1,560. That of the northern districts, Seo, Mahim, and Worlee, has risen from 518 to 649, which is however still below the average.

The *Still-born* were 354, viz. males 218 and females 136, being in the proportion of 160 males to 100 females. This excess of males, though still very great, is below that of the last two years, but although it is well known that a somewhat larger proportion of males than of females are usually born dead, this great excess cannot be thus accounted for, and it forms one among many indications of the great difficulty of obtaining any accurate information regarding births.

Of the total of persons who died, 9,897 bodies were buried, 4,750 were burnt, and 865 were exposed. The place of birth of 7,616 was Bombay, of 7,802 elsewhere, and of 94 it was unknown; and that of the families of of the deceased was of 3,392 Bombay, of 12,026 elsewhere, and of 94 unknown. The written reports were 1,874, or 12·1 per cent. of the whole.

The meteorological observations show little variation from the average in the barometric pressure throughout the year. The mean temperature of the year was 80·7, which is half a degree above the average. The mean dew point was 72·6, which is also higher than that of last year, and above the average, but there is also the at first sight somewhat anomalous circumstance, that the humidity of the air was lower, or 76 per cent., against an average of 79. This seems to be dependent on the higher temperature of the year, whereby a larger proportion of aqueous vapour was required to produce saturation. At Colaba, 74·0 inches of rain fell on 109 days. The rain fall at Byculla was this year much the same, viz., 76·94 inches, but the number of rainy days was only 100.

ROBERT HAINES, M.B.,
Superintendent of Mortuary Returns.

Bombay, 1*st August* 1863.

SIXTEENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1863.

THE mortality during the past year is the largest that has been recorded in Bombay, and nearly one-third in excess of the average of the previous ten years. The reported deaths after birth have been 19,747, to which being added 458 still-births, a total of 20,205 registered deaths is obtained. The excess of the first number, 19,747, over the mean of the last ten years, 15,280, is 29 per cent.

The total number of deaths from *Cholera*, 2,742, is about 50 per cent. in excess of the average.

Small-pox has been particularly fatal this year, having carried off 1,113 persons, nearly twice the average number, but much less than in 1858 and 1861, the majority, as usual, being children under four years of age. The disease lingered rather longer than usual, quite into the rainy season, and began to make head again immediately after the rains were over. Thus the deaths commenced with 51 in February, reached a maximum of 252 in April, were still in June 209, and after falling to a minimum of 9 in October, mounted again to 65 in January 1864.

The mortality from *Measles* was 492, or nearly twice the average; by the end of the year, however, the disease had almost disappeared. The total deaths from epidemic diseases were 4,347, against a ten years' average of 2,790.

Under *Fever* are returned 9,499 deaths, being the largest number ever before registered; this is 2,566 more than last year, and 2,370 in excess of the average.

Diseases of the *Nervous System* account for 674 deaths, or 63 above the average. Diseases of the *Respiratory System* caused 946 deaths, which is 244 less than the mean. Diseases of the *Alimentary System* 2,129 deaths, or 236 more than the mean; *Cachexies and Debility* 1,427. The total deaths, exclusive of those from epidemic diseases, were 15,400, being 1,454 more than the largest previously recorded, and 2,915 beyond the average.

The first month of the year, February, was not characterized by any unusual mortality, but in the following month the deaths at once rose much above the average, and remained so, with a tendency to further increase, to the end of the year. The ratios per cent. of the deaths in the several quarters of the year were as follows:—

	Epidemic Diseases.		Non-epidemic Diseases.		All Causes	
1st Quarter	21·0	55·6	22·6	46·5	22·3	48·6
2nd "	34·6		23·9		26·3	
3rd "	16·0	44·4	26·0	53·5	23·8	51·5
4th "	28·4		27·5		27·7	

Here, although the number of deaths from epidemic diseases, Cholera, Small-pox and Measles, was so much greater in the first two quarters than in the last two, those from the non-epidemic diseases are so much in excess in the last quarters as to impress that excess upon the total mortality. The increase in the non-epidemic class is steady throughout the four quarters, and by inspection of Table XX. it will be at once perceived that this is exclusively due to Fever. The ratios per cent. of the deaths from this cause in the four quarters are 22·4, 23·2, 24·8 and 29·8. In the last month of the year the deaths from fever were the largest of all, viz. 1,140, or 12 per cent. of the mortality of the year from that cause.

If to the excess of the epidemic mortality above the mean, which is 1,557, we add that of fever 2,370, the sum 3,927 deducted from the total mortality of the year leaves 15,820, which is only 540 above the mean of ten years, to be distributed among all the other classes, which is hardly more than may fairly be attributed to the increase of population.

The mortality from epidemic diseases is subject to great fluctuations from year to year and from month to month, so that the increase in the deaths from these causes in the past year is nothing surprising. But the deaths registered under the head of Fever hitherto have been remarkably constant in number, not only in the several years, but from month to month. During all the previous ten years the highest number was 8,458, and the lowest 6,231, the first 1,329 or 18·7 per cent. above, the last only 898 or 14·4 per cent. below the average; and on inspecting the tables of former years corresponding to the present Table XX., no monthly fluctuation or progressive increase comparable to that of the last year will be observed. The inference is, that Fever (or the maladies classed under that head,) has during the year past assumed a form of greatly increased virulence. The increase too is yet progressing. So remarkable a deviation from the phenomena of previous years points to the existence of adverse hygienic influences hitherto unknown in the like degree, acting upon large masses of the population.

Now the great increase in the total mortality, and the notably augmented commercial and constructive activity consequent on the American war, render it almost a matter of certainty that the population has of late advanced with a rapidity outstripping that of former years. But on the other hand it must be acknowledged that the house accommodation, no less than the conservancy, scavenging and drainage, has not kept pace with the increase. The rise in the price of provisions and fuel has been absolutely alarming. The old relations of demand and supply in labour, food, and residence, have been overthrown, and time has not yet been given for the operation of those natural laws which may eventually bring them into more equitable adjustment. While a favoured few have profited enormously by the change, others, and it may be presumed, the bulk of the labouring classes, have been put to the severest straits. The extent to which they are now crowded together in the closely-built houses of the Native town, is fearful; nothing like it has probably been known in India before, nor anywhere out of China.

In all likelihood it is mainly to this latter evil, though assisted by the deficiency of good food, that the vast increase in the deaths from fever observed in the last year is due. Fever is peculiarly the disease generated by the foul air of crowded, uncleanly habitations, for the crowding necessarily augments in a compound ratio uncleanly habits and the evils that result therefrom. The prevalence of Fever has always been the peculiar feature of Bombay in its sanitary aspect, for in the more extended and expansible cities of Calcutta and Madras the proportion of deaths from this cause is singularly small as compared with those in Bombay, and the circumstances abovementioned cannot but seriously augment its present fatality. I am told by those who have constant experience of the diseases which prevail among the Native population, that fever more nearly approaching to the type of the typhus of Europe than has ever before been seen in Bombay, is now very common.

The increase in the deaths from fever compared with the average of the previous ten years is most marked in the following districts:—Colaba, Market, *Mandwee*, OOMBURKHAREE, *Dhobee-tulao*, Bhooleshwur, KHARA-TULAO, GIRGAON, Chaoputtee, *Mahaluxmee*, Mazagaon, KAMATHEEPOORA. In the following districts they have diminished:—Fort, Esplanade, Tarwarree, Seoree, Seo, and Mahim. In Kamatheepoora the fever deaths are twice the average, and 74 per cent. above the highest previous number. In Oomburkharee, Kharatulao and Girgaon the increase is only a little less. (*See* Appendix A.)

Besides Fever, the only non-epidemic class of diseases in which a remarkable increase has occurred is in "Cachexies and Debility." A progressive increase has taken place under that head, the deaths having been this year twice as numerous as in the beginning of the decade, and 40 per cent. above the average. The deaths recorded are chiefly those of infants a few days' or weeks' old, and the increase indicates either a larger number of births, or a higher death rate at the younger ages—it is difficult to say which.

It is sufficiently obvious from the figures in these tables that the state of the public health in this town is in the highest degree unsatisfactory. Causes fatally contributing to this result,—squalid filth within doors and without, deficient arrangements for scavenging and conservancy, and imperfect drainage,—have been amply exposed in the late Sanitary Report of Dr. Leith.

But without at all disparaging the estimate formed of the evil effects on the public health of an atmosphere charged with the noxious effluvia arising from all these sources, it is unquestionable that these effects must be seriously enhanced by the low state of vitality of the mass of the population, caused by the difficulty of procuring sufficient and wholesome food, and especially by their breathing for ten or twelve hours out of the twenty-four the stifling atmosphere of their narrow and crowded chambers, loaded with animal exhalations.

The want of lodging for the labouring classes in London long ago engaged the attention of philanthropists, and the late lamented Prince Consort led the way in founding healthy, comfortable and cheap, but at the same time self-supporting, lodging-houses for labourers and artizans. The munificent donation of an American citizen, Mr. Peabody, to the city of London, has been mainly devoted to the same admirable purpose; the London Jews have combined to erect a fine range of buildings for their poor working brethren; and the noble efforts of Miss Burdett Coutts have also been turned in the same direction. Her magnificent, yet economically-built lodging-houses in the midst of the wretched and neglected district of Bethnal Green have already changed the face of the most dismal suburb, if suburb it can be called, of London, and will secure to her name for many an age to come the blessings of the much-enduring London labourer. To the philanthropic members of this community, whose stores have so lately been filled to overflowing by the misfortunes of our brethren beyond the Atlantic, no fitter thank-offering could be suggested than a work of the same kind. Hundreds, nay thousands of lives might be saved; and by tending to wean the lower classes from the dirty habits engendered by poverty and the mere struggle for existence, it would establish among them a higher moral feeling and greater industrial energy.

There is, however, another and most serious cause of disease external to the town, to which allusion may be permitted.

Cholera is classed, and truly so, with the epidemic diseases, yet in one respect it differs remarkably from the other diseases so classed in the returns. Small-pox and measles are often almost, and at rare intervals quite, extinct in Bombay; they recur however, though with very varying intensity, yet in order of time, with the utmost regularity at a particular period of the

year, appearing in December, and disappearing or nearly so in June. The virus which causes them is evidently dormant in the rainy season, but awakens to renewed activity when the weather becomes more favourable. It is very different with cholera. Although, if a number of years are taken together, a certain periodicity in its prevalence can be made out, the mortality attaining a maximum about April, and a minimum about September, yet from year to year the utmost irregularity prevails. The disease, from finding here such favourable conditions for its existence, has become endemic; it is never altogether absent. While in this endemic condition not only does it attack fewer persons, but the attacks are comparatively manageable; but from time to time it bursts forth with extraordinary violence, as if it were quite a new disease, and the attacks are then both vastly more numerous and more fatal. It is of some importance to ascertain if this intensification of the morbid poison has its origin in Bombay, or is due to some influence imported from without.

Now in several former Mortuary Reports the commencement of an outbreak of cholera has been made an object of special inquiry, and its origin has been to some extent traced. In the report for 1849, it is shown that up to the month of August in that year cholera was all but extinct in Bombay, only six deaths having occurred in the first six months of that year. It suddenly appeared in the middle of August; in September 690 persons died, and by the end of the year it had destroyed 2,363. It was found that the disease had prevailed to some extent in the neighbourhood of Sholapoor in May of that year, but not enough to excite uneasiness. In the latter end of July or the beginning of August it began to spread with the utmost rapidity, and appeared simultaneously in the Conkan in villages far apart from each other, but all in the line of roads leading directly from the Deccan. In another week it had reached Bombay. It raged throughout the four following years, carrying off a maximum of 3,353 in 1854, after which the mortality gradually declined until in 1858 only 105 persons died.

In 1859 the deaths were again 2,265. The disease appeared about the second week in May in the Waee district of the Sattara Collectorate and about Bhor, and then slowly spread, travelling through the Concan to Bombay, where it appeared at the latter end of the month, and was so fully established in June, that in that month 843 deaths occurred.

Cholera again slowly subsided. In 1861, during the first ten months there were only 160 deaths, but in the month of December it suddenly appeared and carried off 466 persons, and in the next month 625. In this case the spot where it originated in the town was pretty clearly ascertained. It commenced among the families of one of the native Regiments on the Esplanade, and among a party which had just arrived from one of the large towns of the Deccan, where the disease was rife. After January 1862 it somewhat subsided, fluctuating about an average of 200 a month, and reached a minimum of 50 in February 1863. From that time the number of deaths slowly rose, until in June they were 161; then suddenly mounted in the next month, July, to 412, and afterwards again fell. In December the number of deaths had crept up to 319, and in January sprang up to a maximum of 622.

It may be noticed that these exacerbations of the disease in July and December nearly synchronize with the former outbursts—that of August in 1849, and that of December in 1861. Those were pretty clearly traced to the Deccan as their source. I have not at present the means of connecting the temporary increase of cholera in Bombay in the month of July 1863 with the Deccan, though from the facts stated below, it is in the highest degree probable that some such connection existed; but, that the great outbreak in December last was due to contagion imported thence, there can be no reasonable doubt. For days before the disease broke out here, it was notorious that the pilgrims returning from the fairs of Punderpoor and Alundee were dying by hundreds, and the introduction by them of the disease into the city of Poona was greatly dreaded. And not without reason. It soon appeared there, carrying off scores daily, and very shortly afterwards the rapid increase in the Cholera mortality in this town showed how quickly the contagion spread along the ordinary line of traffic.

The great religious fairs or *jattras* of Punderpoor and Alundee take place twice a year, in July and November. In the beginning of December there is also the much-frequented fair of Jejooree, and the more distant one of Savadatee in the Southern Maratha Country. They are supplemented by those of Trimbuk and Bheemashunker in the beginning of March. What concern these and similar *jattras* elsewhere have with the spread of cholera, may to some extent be seen from the following extracts.

To begin with a distant but notorious one, that of Jugganath, at Pooree in Orissa.

"The Cholera morbus has been unusually destructive this year (1844) in the City of Calcutta, nor has it yet subsided entirely. The pilgrims from that neighbourhood set out for the Rath festival and carried the seeds of the disease with them, spreading the infection all along the way. It made its appearance on the track of the pilgrims in the town of Cuttack, early in June. Several were seen dead and sick under adjacent trees, or by the way side; affording an omen of what might be expected, when the whole mass of pilgrims should be condensed into one confined and dirty place: worn and weak with travelling, ill-clothed, ill-fed, suffering exposure, and breathing tainted air,—predisposed to receive and propagate the contagion of death. * * * * Near Cuttack, and along the road, we passed a good many dead pilgrims, and many more sick ones. The darkness of night cast a veil over the dying and the dead, but occasionally the light of our torches fell upon the victims, and for a moment exposed them to our view as we hastened along. As we advanced near to Púrí, and the light of the morning uncovered the scene on either hand, we had a true and appalling picture of the progress the disease was making among the infatuated pilgrims. Still there were many more sick than dead, intimating the commencement of the pestilence. Many of the sick had engaged dúlís, and in these were making a push to reach the limits of the sacred Kshetra; few would be able to accomplish this, which accounts for the large accumulation of dead bodies within the first three miles from Púrí. Many of the dúlís were put down, and the bearers were watching, at a distance, till they could roll out the sufferers and decamp with their booty. Many also had evidently been so served. * * *

"*June* 14*th*.—We found many dead and dying pilgrims outside the Tax Office gate; they lay by four and five together on particular spots. In the town, also, we passed many cases—in one place four, in another six, and in another seven; besides single bodies in every direction. * * *

"15*th*.—The dead and expiring pilgrims were lying thick about the streets, by the sides, and at the corners of the roads. Under one tree we counted seven, who have found their place there since the morning. * * * *

"17*th*.—This morning we were out among the people. * * * * Numbers of dead bodies, in different stages of decay, were scattered all over the deadly

place. The sand was black with the ashes of innumerable funeral piles of the living and the dead. * * The bones of pilgrims, bleached by the rains and the sun, were scattered widely in all directions, forming a strong contrast with the blackened sand of the horrid spot. The smoke of several funeral pyres was blowing over the scene, and conveyed the smell of roasted human flesh through the valley. The contents of a hundred thousand bodies, with the pestiferous stench from scores of decaying corpses, thickened the atmosphere with deadly vapours. The howling of the wild dogs and the screaming of the vultures, too full to move away from the spot;—all these causes combined, gave to the scene the appearance of horror, and made us feel that we were passing the purlieus of death. * * * * *——The whole mass appeared as if stricken with fear; and many cholera patients are carried out on dúlís. They will be left generally in the first three miles of the town. Their bones, as well as those of many pale pilgrims, will be left by the road side, and mark the way to Jagannath's temple in Orissa for many a mile on the road.——— Through mercy we reached home [Cutttack] in health and safety on the 20*th*. The mortality on the road from Púrí to Cuttack almost defies description. The bodies lay thick for several miles on this side Púrí; frequently several in the same place. The sick also and dying were numerous. * * * * A lakh and a half [150,000] of pilgrims is about the number which was present at this festival." (*The Rev. C. Lacey, in Calcutta Christian Observer*, 1844.)

The following from the Bombay Presidency:—

"We are well satisfied that, for the last eight or ten years, the prevalence of Cholera in this district [Ahmednuggur] can be traced almost universally to the pilgrimages made to Punderpoor. Whenever a pilgrimage occurs there, cholera almost invariably breaks out among the assembled crowds: people become frightened, and return with all speed to their respective villages; and, in a few days, you will hear of the cholera in this village and in that, all over the district. Many pilgrims die on the road as they return to their homes; and when they stop for the night, the cholera is sure to commence immediately." (*Dnyanodaya, August* 1844.)

This from a truthful eye-witness:—

"I paid my annual visit to Punderpoor in November [1863]. Great multitudes from all parts of the country come at that season, sometimes from incredible distances, to the shrine of Vithoba. * * * * In a flowing stream, in thousands, they pass on to the shrine from every direction; weary and worn

they then encamp near the town, mostly in the bed of the river. Some have tents, some light cloth sheds, many nothing at all, to protect them. First comes a day of fasting, distinguished by eating either nothing or else unwholesome trash, and by shouting forth by day and by night, with clang of cymbals, and violent gesticulations up to the last ebb of strength, the names of Vithoba and his wife and their 'saints.' Add to this, that the whole atmosphere becomes frightfully tainted from the first, so that one cannot walk anywhere, far or near, without being sensible of the most sickening odours. Can it be wondered at that cholera is very often generated at the place? But the peculiar seed-plot where that pestilence first germinates remains to be described. It is believed that it is *the very temple of Vithoba itself*, a small stone room, with no aperture but a small door, into which perhaps 50,000 persons in the course of a few days force their way, and in the immediate neighbourhood of which, in the temple court, may be seen thousands of men and women sitting closely packed, waiting for their turn to enter. So polluted does the air of the temple become, that the vapour from the breath and bodies of the worshippers condenses on the image, thus giving rise to the idea that the god miraculously perspires. The Sub-Assistant Surgeon, now appointed by Government to Punderpoor, stated to me his belief that the disease, in its first origin, could usually be traced to *that spot.* * * * * * * *

The day after I left Punderpoor, cholera in a bad form manifested itself among the pilgrims, but yet many did not die. The disease might have died out if it had not been cultivated. But the same pilgrims immediately resorted, as is their wont, to Alandi near Poona, and there it met with a favourable field in which to grow. The seed sown at Punderpoor ripened quickly and fearfully at Alandi; and the grain was then scattered broadcast over the length and breadth of the land by pilgrims on the way home. Poona was one of the first places to suffer, and a vast number died in it. The moment the returning pilgrims reached my field of labour [Sassoor], the disease appeared, and the people began to die. * * Every village almost had its sad tales to tell." (*Notes by the Rev. Adam White, dated 28th January* 1864.)

Within a very few months from that date this good man fell a victim to the disease, contracted in ministering to the necessities of the cholera-stricken inhabitants of Sassoor.

It can hardly be questioned, then, that of all the influences at work in this country in promoting the spread of cholera, none can bear the least comparison with these jattras. But for them in all probability cholera might die out here, as other prevalent epidemics not of an eruptive character have died out elsewhere, under improved sanitary conditions. But the jattras effectually prevent this desired consummation. While one epidemic visitation is slowly subsiding, and assuming a light sporadic form, the lingering seeds of the poison are nursed and intensified at the jattras, and, thus multiplied a thousand fold, they are dispersed over the whole country in all the lines of the pilgrims' travel. In a crowded populous city like Bombay the contagion finds but too congenial a home, and thus thousands of lives are sacrificed here to the superstitions of ignorant devotees hundreds of miles distant.

That the pilgrims should sacrifice their own lives may cause a certain amount of regret, even from a purely economic point of view, but still the chief concern is so far their own; but that they should in their own fall carry to destruction a hundred times their number of victims, innocent of their own folly, and more valuable members of the community, is very grievous. The evil is not diminishing,—it is on the increase. The cheap postage, and more rapid means of communication, enable the interested proprietors of these temples to exert their efforts *ad propagandam* with greater success than ever. Circulars are issued by post to the patels of villages far and near (for communication to the people), specifying the times of the festivals, and extolling the fruits of the pilgrimage; and, from the increased facilities of travel, the distances from which the pilgrims come, and the fame of the temple which follows them to their homes, increase in an ever widening circle.

It is sufficient to call attention to these facts, and to the connection they have with the generation and spread of cholera: it is not within the province of the reporter to suggest the remedy.

The deaths in Bombay in 1863 included 11,087 males and 8,660 females, being in the ratio of 128 males to 100 females. The excess of males is less than in the last two years, but greater than the average. Of the still-born 288 were males and 170 females, or in the proportion of 170 males to 100 females. Of the whole 20,205, 13,697 bodies were buried, 5,549 burnt, and 959 had been devoured by carrion birds. 9,509 had been born in

Bombay, 10,532 elsewhere, and the birth place of 169 was unknown. The families of 3,608 belonged to Bombay, of 16,428 to other places, and the country of 169 was unknown. (Appendix B.)

The written reports were 2,280, or 11·6 per cent. of the whole. Of these, 1,632 were given officially by medical and other officers of Government, including six from a French ship of war; 166 by graduates of the University and of the Grant College, and 11 by European medical men. Only one private European practitioner contributed written reports—five in number. It is proposed to introduce a more convenient mode of issuing the certificates of the cause of death, which may be expected to lead to greater regularity in their use.

The deaths by violence were 208 in number—145 males and 63 females. Of these 81 were drowned, 12 burnt or scalded to death, 28 were killed by falls from various heights, and 14 from injuries received from falling bodies; 9 only from horse and carriage accidents, including one from a street roller, 12 from railway accidents, 3 from drunkenness, and 16 from poisoning by arsenic, mercury, or opium; 4 from snake bite, 1 from the bite of an ass, and 2 from incised and 1 from gun-shot wounds. The total number of violent deaths is large, but not greater than in 1861. Of the 81 deaths by drowning, the particulars of 47, or of more than half could not be ascertained. The total acknowledged suicides were only 13, viz. 7 by drowning and 2 by hanging, and 4 by poison. There were no deaths from machinery, which speaks well for the management of the extensive manufactories now at work in Bombay.

The year 1863 was rather wetter than the year before, but near the average. The rain-fall at Colaba was 77 inches, and at Byculla 80 inches, close to the average. The mean annual temperature was 79·5 or half a degree below the average; the dew-point 70·4, which is also a trifle below the mean. The wind azimuth is given this year in a tabular form, instead of diagrammatically. (Appendix C.)

ROBERT HAINES, M. B.,
Superintendent of Mortuary Returns.

Bombay, 31st *August* 1864.

APPENDIX A.

TOTAL DEATHS in each LOCALITY from 1853 to 1863.

XVI.

DEATHS from different CAUSES, in different MONTHS, arranged in QUARTERS, for the Year beginning 1st February 1863.

	Cholera.	Small-pox.	Measles.	Fever.	Disease of Nervous System.	Disease of Vascular System.	Disease of Respiratory System.	Disease of Alimentary System.	Disease of Urinary System.	Dis. of Sexual Syst. & Child-bearing.	Disease of Locom. & Teg. Systems.	Cachexy and Debility.	Leprosy, Tubercular & Articular.	Dropsy.	Accident and Violence.	Other & Unknown Cause.	All Causes, except Still-born.	Cholera, Small-pox, and Measles.	All other Causes.

SEVENTEENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1864.

Large as the mortality in Bombay was in 1863, it has been far larger in the year under report. The recorded deaths after birth has been 25,206, and, including 430 still-born children, a total of 25,636 deaths has been registered. Last year there were but 19,747 deaths after birth, showing an excess this year over the last of 5,459, or 27·63 per cent., and exceeding the mean of the last ten years, 15,863, by 9,343, or 58·9 per cent. In the first complete year of the Mortuary Registration, beginning 1st February 1849, 12,993 deaths were recorded, so that, taking these two years alone, the increase in the number of deaths in fifteen years has been 94 per cent. Taking the average of the first two and the last two years, 14,984 and 22,476, the increase is exactly 50 per cent.

Among epidemic diseases *Cholera* has been unusually fatal, having caused the very large number of 4,588 deaths, nearly one-fifth of the whole. This number has been only once exceeded, in the great cholera year 1850, when 4,729 persons died, but it is greater than the average of the preceding ten years by 2,581, or 129·3 per cent. The activity of the disease underwent little change throughout the year, except that it passed through the usual periodic fluctuations. There were 401 deaths in January, rising to a maximum of 837 in May, falling to a minimum of 88 in October, and rising again in December and January to the number with which the year commenced.

Small-pox also has been very destructive, having caused 1,678 deaths, which is 977, or 139·4 per cent., above the average of ten years past, and 22 more than the greatest number before recorded. At the conclusion of the year it appeared to be subsiding. The deaths from this disease, so easily prevented as to require only the most passive coöperation of the people with the efforts of Government in promoting vaccination to be almost eradicated, were 6·7 per cent. of the whole, so that from this one disease alone one person in every sixteen loses his or her life because the parents are too ignorant or indifferent to take the simplest means to preserve it. As usual, the proportion of female children who die from small-pox is much greater than it is from any other disease.

Measles caused 141 deaths, which is less than half the average, but the disease was not entirely absent in any part of the year.

The above three diseases, classed together as *epidemics*, caused the death of 6,409 persons, or 25·4 per cent. of the whole mortality, the ordinary average being but 19 per cent.; so that, large as the total number of deaths has been, an undue proportion has still been caused by epidemic visitations.

But among all the causes of death the most striking numerical result is under the head of *Fever*. In this last year the deaths from fever alone were 13,035, or equal to the entire mortality of the island a fifteen years ago. This exceeds the number in 1863, 9,499, by 3,536, or 37·2 per cent., and the mean of ten years past by 75 per cent.; and the deaths from fever constitute upwards of half, or more exactly 51·7 per cent., of the entire mortality of the town. The fever mortality is unequally distributed between the sexes: compared with the total mortality in the two sexes the female deaths from fever are year by year constantly in excess of the male, and in some years, notwithstanding the numerical preponderance of male deaths from all causes, a nearly equal number of females and of males die from fever, and at a certain period of life there is an almost constant absolute majority of female deaths. This is at the early ages of four years and under, the same, in fact, in which a similar result is seen with small-pox. A possible explanation of this fact is that the girls are kept more at home, where the vitiated air of the overcrowded dwelling-houses acts more injuriously upon them.

In the other classes of diseases there is very little variation from the mortality of last year, except that under *Diseases of the Alimentary Canal* the deaths have been fewer, or 1,900 against 2,129. The increased mortality, then, of the year is due to three diseases, cholera, small-pox, and fever.

No less than 292 deaths were attributed to *Accident and Violence.* Of these 110 were by drowning, 53 by falls, 24 by falling earth and stones consequent on reclamation and blasting operations, and 6 from other falling bodies; 15 from railway accidents, 5 from carriage accidents, 4 from gunshot wounds, 4 from snake-bite, 10 from burns, and 1 from machinery; 6 persons died from the immediate effects of drinking, 2 from poisoning by arsenic, and 9 by opium, 9 children from want of breast milk, and 2 persons by judicial hanging. The causes of the remaining violent deaths were imperfectly recorded. In 29 cases of coroner's inquest the bald and unsatisfactory verdict of "found dead" was recorded, and in 31 cases that of "found drowned."

Of the total deaths 14,949 were males and 10,257 females, or in the proportion of 145·7 males to 100 females. This proportion is far larger than has been before recorded, and approaches to the ratio of the sexes observed in the Census Returns, viz., 185·4 to 100. The still-born were 480, viz., 254 males and 176 females, or in the proportion of 144·3 to 100.

An improvement was noticed in the number of written reports of death, which were 3,119 or 12·2 per cent. of the whole. Upon the increase of these he accuracy and much of the value of the returns will depend.

In last year's Report was noticed the marked increase in the number of deaths which had occurred in certain districts of the town, especially in Oomburkharee, Khara-tulao, Girgaum, and Kamateepoora. It is in the same districts that the chief increase is observed this year also, especially the last; the total deaths in Kamateepoora have risen from 2,360 to 3,322, the average of the previous five years having been but 1,512. The chief increase has been from fever, though small-pox has been unusually destructive in the district.

The Census of Bombay taken on the 2nd February 1864, though not considered absolutely correct, yet is probably quite sufficiently so to allow of a fair general estimate being made of the death-rate among the population.

Assuming that the numbers of the population remained unchanged throughout the year,* the tables C, D, and E in the Appendix show the rate of mortality in each police district, in each caste or race, and in persons connected with each occupation. Amongst the 816,562 persons living, 25,206 deaths occurred—3·087 per cent., or one in 32 persons. Taking the localities separately, the highest death-rate is found in Chaoputtee, being 6·242 per cent., or one in 16, and the lowest in Seo, 1·706 per cent., or one in 59. The Water Division, it is true, shows a mortality of only ·832 per cent., but this may be passed over, as a large proportion of the harbour population have their homes on shore, whither they resort when sick, and consequently the deaths which take place in the harbour itself are very few. The next highest are Mazagon 5·210 per cent., Esplanade 5·045, Khara-tulao 4·613, Kamateepoora 4·063, Girgaum 3·959, and Walkeshwur 3·517. The high death-rate in the crowded and ill-drained village of Mazagon is not to be wondered at, but that the Esplanade should be nearly as bad could hardly have been expected. Its chief residents are the men and families of the Native Regiments, and the figures point to some sanitary defect, which might perhaps be removed by thorough investigation.

Table D shows the death-rate in the different castes and races. It is clear on inspection that in the instance of two or three castes the same persons have been entered under different headings in the Census and in the Death Returns. It is impossible that the mortality among Buddhists and Jains should be 12·04 per cent., while among Lingayets and Bhatias it should be only 1·64 per cent. By throwing both together we get a mortality of 4·30 per cent., which is a reasonable rate, and by adding the Brahmuns, of 3·16, which is close upon the average. It will be noticed that there is very little difference between the death-rates of the flesh-eating and the vegetarian sections of the community, but what little difference there is is in favour of the eaters of flesh-meat. The few Negro-Africans, again, show a mortality of 11·52 per cent., but by joining them with the Moosulmans, with whom no doubt they have been confounded, the joint mortality is brought down to 4·12 per cent. The mortality among the several castes and races will then admit of their being placed

---

The rate of annual increase being unknown, no attempt has been made to correct the Census Returns for the estimated increase during the year.

in the following order, beginning with that which has the highest death-rate :—

1. Hindoo Outcastes.
2. Europeans.
3. Moosulmans and Negro-Africans.
4. Boodhists, Jains, Lingayets, and Bhatias.
5. Jews.
6. Native Christians.
7. Hindoos " of other castes," Marathas, &c.
8. Parsees.
9. Indo-Europeans.
10. Brahmuns.

The attempt to deduce the death-rate in the different occupations has led to somewhat singular results. The figures show at a glance that in the majority of cases no sort of agreement exists in the distribution of the living and of the dead under the various occupations.* Thus, to take extreme cases, out of 1,741 toy makers and dealers, and 2,291 umbrella makers and dealers, only 1 in each class died, or ·06 and ·04 per cent.; and out of 14,195 wool workers and dealers, only 4, or ·03 per cent.; while out of 9,649 clothiers 1,139 died, or 11·80 per cent., and of 106 civil engineers 20 died, or 18·87 per cent. It is therefore quite useless to attempt to draw any conclusions whatever from these figures. It is impossible to say how far the inaccuracy rests with the Census or how far with the Death Returns; probably both are at fault; but it is some argument in favour of the Death Returns that they exhibit a tolerable uniformity under the various headings from year to year.

* *See* Appendix E.

The usual Meteorological Report will be found at the end of the Tables. The mean barometric pressure is somewhat higher than in the previous year, and the variations have been great. The mean temperature was ·8° higher than last year, and a little above the mean. The dew-point was ·5° higher. But the rain-fall was singularly deficient; though a trifling fall took place in November and again in January, the total rain-fall hardly reached 46 inches at Colaba. At Byculla, however, 57·4 inches were registered. This is a much greater difference than usual, and is entirely due to the excess registered at Byculla in the month of June, at the beginning of the rains. In the other months the difference is hardly perceptible.

ROBERT HAINES, M. B.,
Superintendent of Mortuary and Birth Returns.

Bombay, 9th January 1866.

APPENDIX D,

Showing the DEATH-RATE in the different CASTES and RACES.

1864.

Caste or Race.	Living 2nd February 1864.	Dying in 1864.	Mortality per cent.
Boodhists and Jains, &c.	8,021	966	12·044
Brahmuns	30,604	608	1·986
Lingaets and Bhatias	23,369	384	1·643
Hindoos of Other Castes	491,540	13,000	2·645
Hindoo Outcastes	32,434	1,774	5·470
Moosulmans	145,880	5,853	4·012
Parsees	49,201	996	2·024
Jews	2,872	89	3·099
Native Christians	19,903	600	3·015
Indo-Europeans	1,891	38	2·010
Europeans	8,415	363	4·730
Negro-Africans	2,074	239	11·524
Boodhists, &c., Lingaets, and Bhatias	31,390	1,350	4·301
Moosulmans and Negro-Africans	147,954	6,092	4·118
Asarcophagous Castes	61,994	1,958	3·158
Sarcophagous do.	754,568	23,248	3·081

APPENDIX E,

Showing the DEATH-RATE in different OCCUPATIONS.

1864.

Occupation, or that of Family.	Living 2nd February 1864.	Dying in 1864.	Mortality per cent.
Annuitant, Independent	15,632	38	·21
Auctioneer	1,243	1	·08
Baker, Grain-parcher, Cook, Confectioner	20,356	188	·92
Beggar, Vagrant, Pauper	27,046	1,348	4·98
Bracelet maker, dealer	4,506	25	·55
Bullock-driver, Dairyman	16,743	846	5·05
Butcher	2,973	122	4·01
Cane-worker, Palm-leaf-worker	2,802	33	1·18
Charcoal-dealer	1,206	8	·67
Clothier, Draper, Mercer	9,649	1,139	11·80
Coppersmith, Brazier	5,418	92	1·70
Cotton worker or retailer	17,179	27	·16
Crockery, Glass, dealer	3,097	6	·19
Domestic Servant, Barber	52,189	1,453	2·78
Druggist, Perfumer	3,126	2	·06
Dyer	2,463	147	5·97
Engineer (Civil)	106	20	18·87
Engine driver, stoker, maker	1,849	17	·92
Fisherman, Fishmonger	11,252	300	2 67
Gardener, Greengrocer, Agriculturist, Hay and Straw dealer	14,990	674	4·50
Gold, Silver, smith, Jeweller, Watchmaker	12,457	313	2·51
Grain dealer or grinder	5,754	8	·14
Grocer	9,543	332	3·48
Gunpowder, Firework, maker, dealer	2,217	15	·68
Hawker	5,510	24	·44
Hemp, Coir, worker, dealer	3,405	70	2 06
Horse driver, dealer, Farrier, Groom	15,927	520	3·26
Iron worker or dealer	15,550	142	·91
Labourer	191,090	8,726	4·57
Lawyer, Covenanted Civil Servant of Government	299	8	2·68
Leather maker, worker, dealer	6,305	386	6·12
Liquor seller, distiller, Palm-wine drawer	11,502	277	2·41
Marine stores dealer	1,830	5	·27
Maritime man, Boatman	40,584	1,073	2·69
Mason, Quarryman, Lime, Stone, worker, dealer	17,567	437	2·49
Medical man	5,462	41	·76
Merchant, Banker, Broker	37,071	1,193	3·22
Military man or Pensioner	8,777	497	5·66
Money-changer, Assayer	3,683	88	2·39

Occupation, or that of Family.	Living 2nd February 1864.	Dying in 1864.	Mortality per cent.
Musician	3,464	41	1·18
Oil drawer, dealer, Soap-maker, Candle-maker	3,385	60	1·77
Painter	2,720	9	·33
Policeman, Watchman, Messenger, Tax-gatherer	16,203	608	3·75
Porter, Palkee-bearer	8,997	42	·47

GOVERNMENT RESOLUTION 53

To the Inspector General,

Medical Department.

Sir,—On the lamented decease of Surgeon Robert Haines, I was entrusted with the registration of births and deaths for the remainder of the year 1866. I then ascertained that up to this period no steps had been taken to tabulate the registrations for 1865, for the formation of the Annual Mortuary Report. At the request of the Principal Inspector General, Medical Department, (as in the year 1865 the registration of deaths had not devolved on the Municipal Commission,) I undertook the tabulation; and I now have the honour to transmit the Mortuary Report for 1865, and beg you will be so good as to forward it to Government, with the request that it may, as usual, be allowed to be printed.

I have the honour to be,

Sir,

Your most obedient Servant,

T. B. JOHNSTONE, M.D.,

Surgeon Major.

Bombay, 4th March 1867.

EIGHTEENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1865.

In the year 1865 the recorded deaths from all causes, at all ages, after birth amounted to 27,502, being in excess of the mortality of the previous year by 2,296, or 9·11 per cent., and over the mean of ten years by 10894, or 65·59 per cent. The percentage of deaths to population was 3·087 in 1864, and in 1865, 3·368.

Of these deaths, 16,553 were males and 10,949 females; the proportion being 151·2 of the former to 100 of the latter.

There were 393 still-born children not included in the above.

Of the persons who died, 10,226 were born in Bombay, 17,237 elsewhere, and the birth-places of 432 were unknown.

Sepulture was given to 19,226 bodies, 7,651 were disposed of by cremation, and 1,018 were exposed to carrion birds.

In 1865 the proportion of bodies burnt was 27·43, and in the previous year 26·38 to the whole deaths. To deaths of Hindoos the proportion of bodies burnt in these two years was—

1865—47·59.
1864—45·54.

In comparing the mortality of the year 1865 with that of the previous year and with the mean of the last ten years, it is found that from *Cholera* the deaths were 2,537, or 2,051 less than in the preceding year, but 447 more than the mean of the last ten years.

From *Small-pox* there were 566 deaths,—1,112 less than in the preceding year, and 278 less than the mean of the last ten years. To non-vaccination may be attributed the mortality from this disease; "children perish, and parents lose their offspring by neglect of a precaution of the simplest kind."

From *Measles* 400 deaths occurred,—257 more than in the year 1864, and 54 over the ten years' mean. The numerical history of this disease is peculiar. In 1857 there were 1,614 deaths, in 1860 there were 927, in 1863 there were 492, and 400 in 1865. In the intermediate years, commencing in 1855, in which year there was not one death from this cause recorded, it never rose above 164.

The localities of the greatest mortality from epidemic disease were as follows: From *Cholera*—1st, Kumateepoora; 2nd, Oomberkaree; 3rd, Market; 4th, Dhobee Tulao; 5th, Chuckla. From *Small-pox*—1st, Mandwee; 2nd, Kumateepoora; 3rd, Chuckla; and following these were the North Fort, Market, Oomberkaree; and Dhobee Tulao. From *Measles*—1st, Kumateepoora; 2nd, Market; 3rd, Dhobee Tulao.

The fourth class of causes of death is *Fever*.

From this one cause alone the reported deaths were 18,243, giving 2·234 per cent. of deaths to population, and 65·39 per cent. of the total mortality. The present imperfect mode of registration, though as carefully conducted as could be, has always rendered it impossible to classify correctly the death causes which are rendered under the name of fever. There was, however, no doubt a prevailing type; and if the deaths in the large Native Hospital of the City, in which the admissions and mortality exceeded those of any previous year, may form a guide, we must suppose that a low remittent fever prevailed during the year. Of the above, 10,566 were males and 7,677 were females. An excess of 5,208 deaths is thus shown from this cause over the previous year; in one lustrum an increase of 11,219, and 10,336 over the mean of ten years.

Fever appeared to have kept pace with the known influx of the labouring classes of both sexes during the years 1863-64 and 65, in which there can be little doubt but that overcrowding had been gradually

extending, and that hard labour with exposure, vitiated air of crowded dormitories,—in many cases a want of nutritious food, and high wages with consequent dissipation,—were engendering their well-known evils among the poor and badly bestowed classes of the community.

In the first quarter of the registration year, viz. from February to April, fever deaths were 6·859, in the second quarter 5·074, in the third 3·331, and in the last, ending January 1866, they fell to 2,979. In the month of March there were 2,410 deaths, in April 2,588, in May 2,461. Here the progress of fever seemed to have been arrested, for from this month the mortality decreased, and in the last three months of the year under report the deaths were less than in the same months of the previous year, and in January less than in the same month of the two preceding years, 1863 and 1864.

The demands on the labour market had been gradually decreasing in the latter part of the year 1865, and with the falling off there was doubtless a large exodus of the labouring "fluctuating population."

The vigorous carrying out of a more perfect system of sanitation was likewise beginning to be felt.

The ages at which the highest rates of mortality from fever existed, were from 25 to 44 in both sexes; the next ages were from 14 to 24. The localities of—1st, Khetwadee; 2nd, Khara Tulao; 3rd, Kumateepoora; 4th, Chaopatee; 5th, Khoombarwada, then Chuckla and Dongree, are those, in order of precedence, in which fever deaths bore greatest on the population: while in proportion to other diseases the rates were highest in —1st, Kumateepoora; 2nd, Chuckla; 3rd, Oomberkhadee, Dongree, and Khetwadee. The minima of deaths from fever to population were in Seoree, Seo, South Fort, Girgaum, Mahim, Worlee, and North Fort. In proportion to deaths from other causes, the minima were in Seoree, South Fort, Seo, Worlee, Parell, and Tarwadee.

The localities are here particularised, as the results appear to point out where measures might be taken not only to decrease present overcrowding, but also for initiating precautionary arrangements to prevent its great recurrence in the future.

Under classes of Causes of Death, from V. to XI., the mortality was generally less than in the previous year.

In Class XII., Death from Cachexia and Debility, there was a mortality of 1,606; in the previous year there were 1,471 deaths under this head; showing in the year under report an increase of 135, and an excess over the mean of ten years of 385. Of these deaths no less than 1,132 were children under 15 days old.

Class XIII., Leprosy, gave 34 deaths; there were 40 from this cause in 1864.

Deaths from Dropsies, Class XIV., were 100; in 1864 there were 117.

Class XV., Violent and Accidental Deaths.—The largest number of deaths from this cause, since the commencement of registration, occurred in the year under report: they amounted to 338,—47 over the number recorded in the previous year, and 148 over the mean of ten years. Out of the above number, 263 were males and 75 females; 38 of these deaths were from injuries connected with railways; 35 were from accidental drowning in ditches, quarry holes, tanks, and wells; 5 suicidal in wells, 1 in tank, 1 in a quarry hole. Drowning during periods of insanity and intoxication caused 6 deaths; 24 bodies were "found drowned" in tanks, 16 "found drowned" in wells, 15 were "found drowned" in the sea, 3 "found drowned" in quarry holes, and 1 "found drowned" in a ditch. 31 per cent. of deaths in the class "accident and violence" are thus attributable to drowning. The facilities given by undefended tanks, wells, and quarry holes to this mode of self-destruction and accident have doubtless been greatly decreased since 1865. 27 deaths occurred from falls from houses, 18 from earth falls or landslips, falling houses caused 3, rock falls and blasting caused 2, 5 were caused by falls from toddy trees, 8 from falls from heights undescribed, 18 from falling of heavy weights, such as cotton bales. Falls and accidents on ship-board caused 12 deaths. Hanging gave 6 deaths—4 suicidal, 1 judicial, 1 homicidal. Poisoning gave 18 deaths—4 suicidal, 11 alcoholic, 3 accidental. 5 deaths ensued from snake bite, 1 from rat bite, 2 resulted from gunpowder explosion. Burns caused 7. 11 deaths

occurred from injuries the causes of which were unknown. Carriage and cart accidents caused 9 deaths ; 12 resulted from being crushed between buffers, gates, carriages, &c. ; 3 from horse accidents, 19 from want of nourishment and starvation ; 3 from cut throats, suicidal ; 4 from wounds, stabs ; 4 were from accidents caused by steam engines, 2 from blows and kicks.

The still-born numbered 393, of which 240 were males and 153 females.

From the death reports that have undergone investigation in the formation of this Report, it is evident that the causes of death are frequently most incorrectly rendered, and the system is one that, however good as a commencement, should now meet with a speedy but well considered alteration.

The written reports, too, are often carelessly given ; and the private medical practitioners of the Island do not give that attention to the subject which is requisite. There were 3,340 written reports, or 12·0 per cent. of the whole ; of the above number not more than 50 were from private medical practitioners. The greatest number were from the Jamsetjee Jejeebhoy Hospital, the Coroner of Bombay, Medical Officers of Hospitals, Regiments, and from relatives.

The mean barometric pressure was a trifle lower than in 1864, the variations were not so great. The mean temperature was 80·7, the mean range was 10·8, and absolute range 39·4. The mean dew point was 72·1, two degrees higher than in the previous year ; and the mean humidity was 76.

Rain fell on 101 days at Colaba, and 94 days at Byculla. The gauge at the former place registered 79·01 inches, and at the latter 73·46. The prevailing winds were NNW., SW., and W., as will be seen by reference to Appendix A.

T. B. JOHNSTONE, M.D., Surgeon Major.
Secretary to the Inspector General, Medical Department.
